

Mmap used.

Key should be greater than 0 and less than 255.

If key is less than 255, set a local variable var20 equal to 0. And enter a loop. Check if var20>70. If yes, then call rdx which contains var18.

If the value of var20<70, then increment by 1.

When the correct value for the key is entered, the flag gets printed.
